During flu season the Arkansas Department of Health (ADH) produces this Weekly Influenza Report for clinicians. The report provides information on flu activity in the state. The report also compares influenza-like illness (ILI) in Arkansas to activity in the US. ADH receives detailed reports of only a small fraction of flu cases. Therefore, it is important to understand that the information in the weekly update is representative of the timing and location of activity, but it does not reflect the overall burden of disease. It is presumed that there are many more people actually affected than the report shows.

Report Summary:

- Since September 28, 2014 (week 40), over 29,000 positive influenza antigen tests have been reported to Arkansas Department of Health by healthcare providers. Among flu antigen tests that can distinguish between A and B strains, 83% were A, and 17% were B. for week 14, about 50 positives were reported from 25 counties, 24% were A, and 76% were B.
- About 58.6% of reported positive antigens were in children 18 years old or less.
- Two samples reported last week were confirmed Positive for influenza by PCR testing were B+.
- Less than 2% of patients visiting ER last week and less than 1% of out-patients visits were for ILI.
- Arkansas reported “Sporadic” influenza activity to CDC for week 14.
- The average school absenteeism rate last week was 5.9%.
- Nationwide, and for week 13, The geographic spread of influenza in four states was reported as widespread; 17 states reported regional activity; the District of Columbia, Guam, and 22 states reported local activity; and Puerto Rico, the U.S. Virgin Islands, and seven states reported sporadic activity.
